News in RSA-RTE 10.1

updated for sprint 2017.13

Mattias Mohlin, March 2017

Overview

- Now based on Eclipse Neon.3 (4.6.3)
 - Many general improvements since Eclipse Mars
- Contains everything from RSARTE 10 and also additional features and bug fixes
 - See the What's New presentation for RSARTE 10 to learn about new features

IBM Rational® Software Architect RealTime Edition

Version: 10.1.0.v20170329_1051

Release: 2017.13

neon.3

- Word wrap in text editors
 - Use the shortcut Alt+Shift+Y or access the "Toggle Word Wrap" command from Quick Access

```
Previous Choices Toggle Word Wrap - Toggle word wrap in the current text editor (Alt+Shift+Y)
```

- Commands for "zooming" in text editors by changing the font size
 - Ctrl++ for zooming in and Ctrl+- for zooming out

- Autosave of dirty editors
 - Set a timer to automatically save modified editors after a period of inactivity
- Terminate and relaunch
 - Makes it simpler for users who prefer to only have one launch (e.g. a debug session) active at the same time
- Shortcuts to recently used workspaces when launching RSARTE

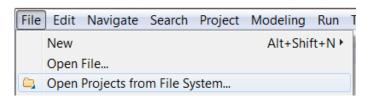

- Command for toggling visibility of window toolbars (to maximize space for editors and views)
 - Assign a keybinding to this command, or access it through Quick Access to the current window access it through Quick Access to the current window to th
- Full screen support (to maximize RSARTE's usage of the screen)

Perspective names hidden by default (to save space in toolbar)

- New smart wizard for importing projects
 - No longer necessary to use different wizards for different kinds of Eclipse projects

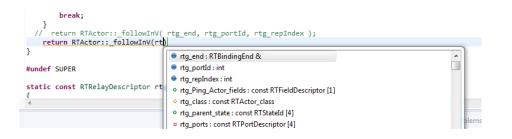

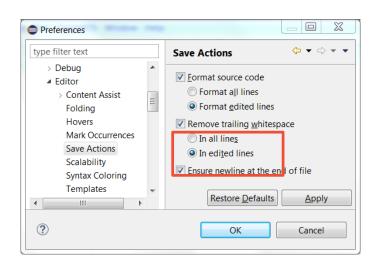

- For more information about Eclipse improvements see
 - News in Eclipse 4.6.3 (Neon) https://www.eclipse.org/eclipse/news/4.6/

CDT 9.2.1 (included as part of Eclipse Neon.3)

- Save Action for automatically formatting edited lines when saving a file
- Parameter guessing when typing function calls

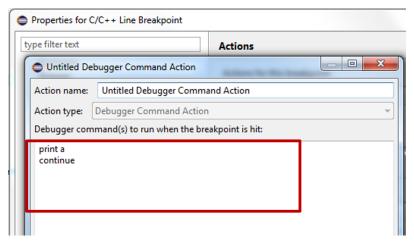

- Support for decltype(auto) type-specifiers
- Expansion of icons in the editor ruler
 - Helps when there are multiple icons on the same source code line

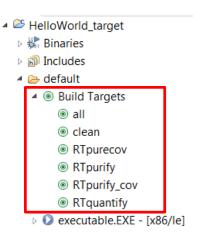

```
322 break;
323 }

Population of the state of
```

CDT 9.2.1

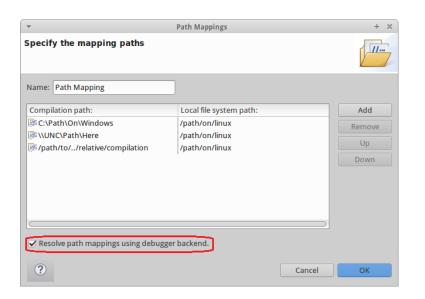

- Command for commenting/uncommenting selected lines in makefile editor (Ctrl + /)
- Build targets (previously called Make targets) now show up in the Project Explorer. They can be run by double-click.
- Support for running commands in the debugger when a breakpoint is hit

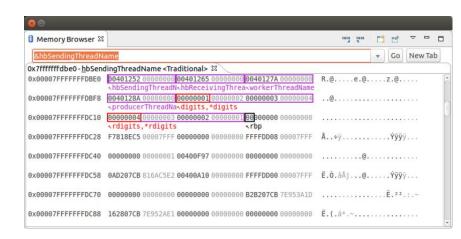

CDT 9.2.1

- Local variables and registers in the Memory Browser
- Improved source lookup when debugging

For more information about news in CDT 9.2.1 see https://wiki.eclipse.org/CDT/User/NewIn90 and https://wiki.eclipse.org/CDT/User/NewIn91

EGit 4.6.1

- RSARTE now includes an EGit integration that is based on the latest version of EGit
- RSARTE files can now be opened in a text editor from the EGit History view.
 - Previously this command was disabled, but its more useful to at least be able to open the files in a text editor
- See https://wiki.eclipse.org/EGit/New_and_Noteworthy/4.6 for news in EGit 4.6.x

Codan

- Codan is the Code Analysis feature of CDT. It has been improved in CDT 9.2.1.
- To use it on the CDT projects generated by RSARTE you should enable the preference UML Development Real Time C++ Transformations Generate additional information for Code Analysis
 - Adds standard include paths to generated CDT projects
 - Makes Codan report much fewer errors, and therefore makes it more stable
 - This is currently an experimental feature
 - Use of this feature may increase the build time somewhat

Improved Text Merge

Merging text (code, comments etc.) is now easier thanks to a new text merge editor

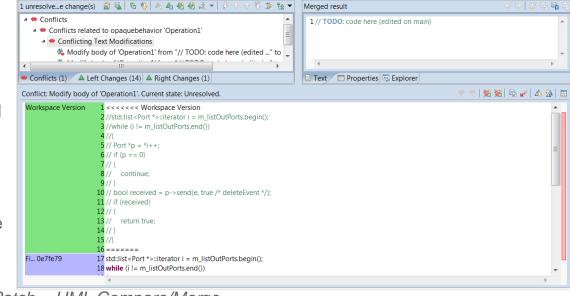

Structural changes

 Replaces the old "sub-merge" (except when 🖆 *Closure Merge on Repository 'git2': Merging 'Fix to the problem reported on site yesterday evening' into 'refs/heads/Fixit' 🗵

merging rich text)

Conflicts can be resolved by choosing the contributor versions, but also by direct editing

- Non-conflicting text blocks are merged automatically but can also be edited if needed
- The editor has line numbers and a Find command
- The "Merged result" view is updated when saving or when the text merge editor looses focus
- Easy to get an overview of all changes made in a merged text compared to the ancestor version
- The colors used can be customized in preferences at General -Compare/Patch – Modeling Compare/Patch – UML Compare/Merge

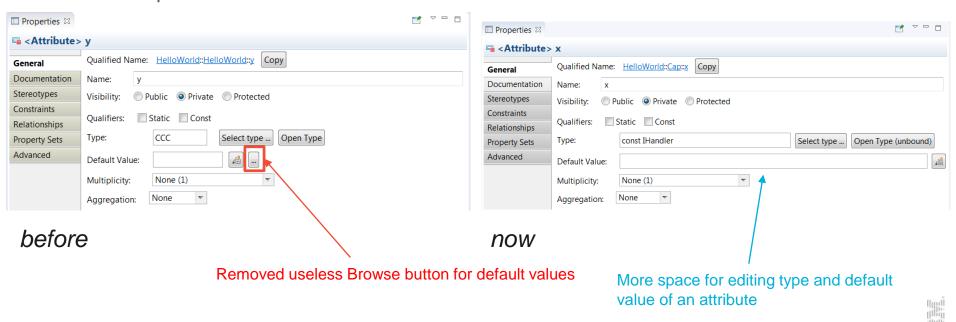

Simplified Compare/Merge Editor

- Some commands were removed
 - Edit Merged Result
 It is recommended to instead use compare/merge tasks to keep track of changes that need to be done after the merge has been completed.
 - Revert Session
 This command did not work in all compare/merge contexts, and it's better to revert a session by simply closing the Compare/Merge editor and launch it again.

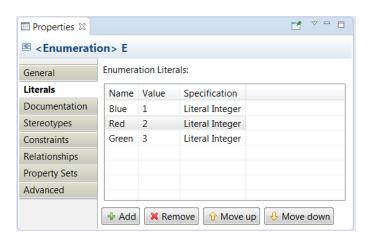

Improved Layout of Property Pages

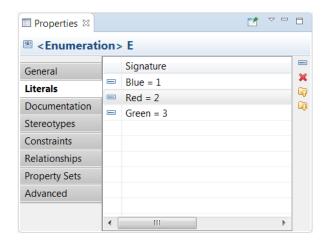

The layout of some property pages have been improved to make them more compact, and to give more space for editing important properties For example:

Improved Editing of Literals and Parameters

- The Properties editor now allows enumeration literals and operation parameters to be edited using textual syntax
 - Similar to how operations and attributes are edited
 - The context menu provides navigation to the literal or parameter

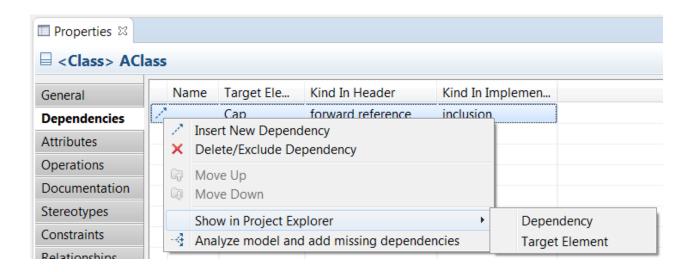

before

now

Navigation from Dependencies

- The Dependencies tab of the Properties view now provides commands for navigating to:
 - the dependency itself
 - the target element of the dependency

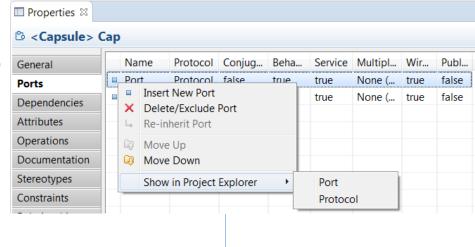

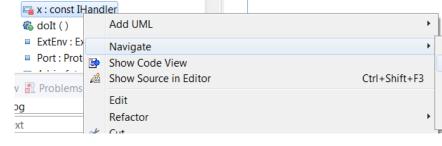

Navigation from Attributes, Parameters and Ports

The Attributes, Parameters and Ports tabs of the Properties view now provides

commands for navigating to:

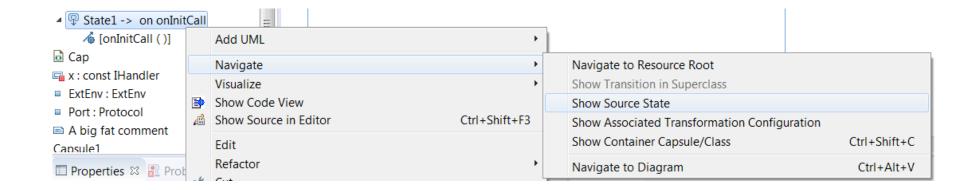

- the attribute, parameter or port itself
- the type of attributes and parameters, and the protocol of ports
- These commands are also available in the Project Explorer context menu

Navigation to Source State of a Transition

 The Project Explorer now supports navigation from a transition to its source state (i.e. the state from which the transition originates)

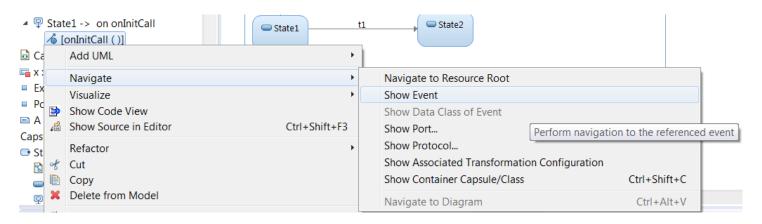

Navigation from Transition Triggers

- Useful navigation commands have been added for transition triggers shown in the Project Explorer. You can now navigate to:
 - the event
 - the data class of the event (if any)
 - the port
 - the protocol of the port

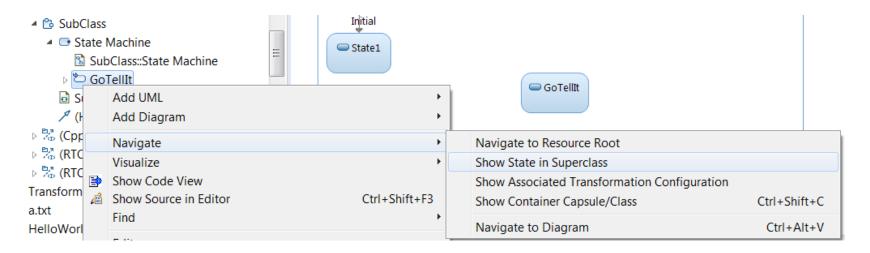

For passive class triggers navigation to the trigger operation is provided instead.

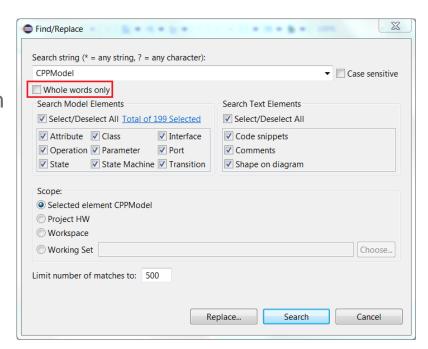

Navigation from Redefined or Excluded Elements

- Navigation commands are now available for navigating from redefined or excluded states, transitions or ports. They navigate to the corresponding element in the super class (capsule).
- These commands are available both in the Project Explorer and in diagrams.

Whole Word Search

- The Find/Replace and Model Search dialogs now has an option for whole word search
- It roughly corresponds to enclosing the search string in double quotes when searching from the search field
- When this option is set, the search behaves very similar to how searching in 9.x worked (it had a similar checkbox)

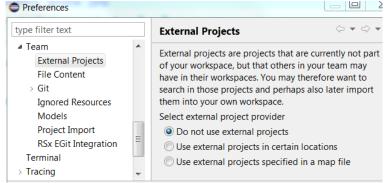

External Projects

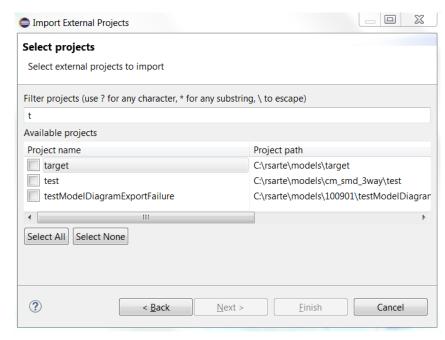

- These are projects that you currently don't have in your workspace, but your team members may have them in their workspaces.
- You can now search in external projects (and import the ones you need from the search result)
- You can also import them directly from a new Import External Projects wizard
- When an external project is imported, dependent projects are automatically imported too
 - Guarantees a consistent workspace for all team members
 - Not necessary for each user to keep project dependencies in mind, when deciding which projects to import

Import External Projects Wizard

- Import Other External Projects
- Before using the wizard you must specify where to look for external projects:
 Preferences – Team – External Projects
 - Certain locations in the file system, or
 - A map file

- In case of ambiguities where to find dependent projects, these can be resolved on the second wizard page
- This way of importing projects is more convenient than importing by means of the general Eclipse Project Import wizard (which does not take project dependencies into account)

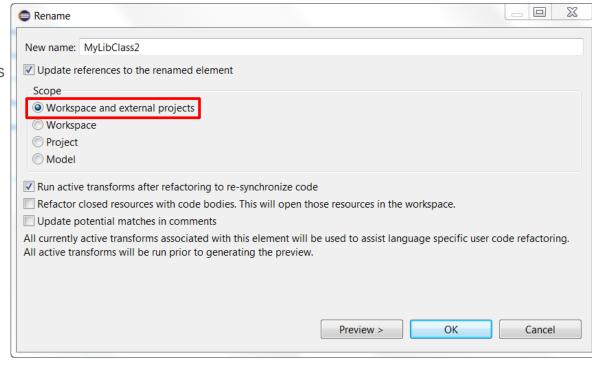

Importing External Projects when Refactoring

When performing a refactoring you want to have in your workspace all projects that may

be affected by it

 For example, renaming an element should rename all references to the element. This means that all projects that contain such references must be present in the workspace when running the refactoring.

- It's now possible to automatically import external projects when refactoring
 - References in the refactored model are analyzed to determine which projects that need to be imported

Loading of Models Imported from External Projects

- It's now possible to automatically load models that are imported from an external project. Set the preference:
 - Preferences UML Development Load models on external projects import

 Note that the preference for automatic loading of models on startup also was moved to this preference page

New Search Scope for Including External Projects

 A new search scope "Workspace and External Projects" is now available in the Scope context menu of the Search field

 This makes it possible to decide whether to search in external projects or not, without having to disable the External Projects preference

Load UML Models

- This command was changed to always load all models in the workspace
 - Users rarely used the possibility to only load some of the models
 - Populating the "Load UML Models" dialog could take a significant amount of time in large workspaces
- In the following API the 'prompt' parameter is now ignored (but kept to avoid API incompatibility):

com.ibm.xtools.modeler.ui.internal.ui.actions.LoadModelsActionDelegate.loadUMLModels(boolean prompt)

Additional API methods were added and are now recommended to be used instead:

IoadUMLModels()
IoadUMLModels(List<IFile>)
IoadUMLModels(List<IFile>, Consumer<Boolean>)

Load everything
Load specified model files
Load specified model files with callback when done

Model Compiler

- Use of the Model Compiler is now the recommended way to build models into C++ applications
 - No longer necessary to have a Display when running command-line builds
- Most features from the classic builder are now supported
 - Inheritance of TC prerequisites
 - "Save before build"
 - Generation of makefiles for external library TCs
 - Only generate code without building it
 - N.B. Some limitations in the Model Compiler still exists (e.g. support for C code), so if necessary you can still use the classic builder
- Makefiles can now be generated with a single rule that will perform all transformations in one step.
 - This can be useful if your build environment does not support parallel processing of make rules, but you still want to drive the entire build from make

Generated make file

- ▼ Include make rules for model-to-code transformation
- Separate. One make rule for each source file.
- Joint. One make rule for all source files corresponding to the same model file.
- Full. One make rule for all sources.

Command-Line Usage of the Model Compiler

- The model compiler requires a license (one per build)
 - Use the command-line option --license to specify the location of the license file or server
 - Alternatively, the environment variable RSARTE MODEL COMPILER LICENSE can be used instead
- Generating build information for a TC
 - Use the command-line options --generate=makefile --genBuildInfoRules --build=build_info
 - A special make target ("build info") will be built which will print useful information about the build, such as the compiler and linker commands that will be used, full paths to source files, etc.
 - The build information file is generated in the same location as the makefile and has the suffix "build_info.js".

Model Compiler Preferences

■ The "Real Time C++ Transformations" preference page allows you to choose if you want to use the model compiler or the old C++ code generator ("Classic Builder") for building your model.

Depending on your choice the applicable preferences will be shown below
 The model compiler supports an extended subset of the preferences supported by the classic builder.

Improved Readability of Generated C++ Code

- C++ code generated by the model compiler now contains comments for states
 - State name (fully qualified name within parenthesis)
 - Generated both for capsules and passive class state machines
 - Helps when debugging generated C++ code

```
    Adder
    SM
    Adder::SM
    Computing
    Adder..Computing
    WaitForIncrement
```

```
break;
case 4  /* WaitForIncrement (SM::Computing::WaitForIncrement) */:
    switch( portIndex )
    {
    case 0  /*RTControlPort*/:
        switch( signalIndex )
        {
        case 1  /*RTInitSignal*/:
        return ;
```

Product News Shown on Welcome Page

- There is a newsletter for RSARTE with new posts approximately every second week
- Now you can view the latest news about the product on the Welcome page (in the What's New section)
- There is also a link for subscribing to the newsletter (by sending a mail to rsarte@se.ibm.com)
